

Call the riskiest orders. Do not hold the customer.

DECISION

Route orders at 15%+ return risk to a same-day confirmation call, then release within 24 hours. Use a service tone for Shield members. Never convert this score into an automatic cancellation or open-ended hold.

0.786

Forward-test ROC-AUC on the newest labelled quarter

60%

Eventual returns captured at the 15% action line

24%

Orders sent to a confirmation call, not a long hold

THE RUPEES / PER 700 ORDERS

₹11,821

estimated monthly net benefit

170 calls $\times$ ₹45 = ₹7,660

~17 prevented returns $\times$ ₹1,150 = ₹19,481 avoided handling

Paid model/API cost = ₹0

WHAT THE NUMBER REALLY SAYS

A 95% accuracy promise is the wrong board measure: saying “no return” for every order already looks 88.6% accurate and catches nothing. At the chosen line, 28% of called orders actually returned and 40% of returns were missed. That is useful for a ₹45 call; it is not safe enough for cancellation. The monthly saving also assumes the spring pilot’s 35% reduction is real—an assumption still needing a controlled test.

EVIDENCE BOUNDARY

2,126 newest-quarter orders
245 actual returns
0.758–0.815 AUC interval

Service and pickup fields were excluded: they occur after dispatch and created a fake 0.996 AUC.

WHAT TO DO NEXT WEEK

1

Start a four-week controlled pilot

Randomly split eligible flagged orders between call and business-as-usual.

2

Protect dispatch and Shield relationships

No hold beyond 24 hours; use service-oriented calls for Shield members.

3

Track the outcomes that matter

Call completion, dispatch time, cancellation, return, Shield status, and reason.

4

Fix the upstream data

October payment scaling, backward-moving history counters, and non-as-of customer dates.
